ALLBANK EDITION

Foreword

AllBank has served the Philippine market in different institutional forms for more than six decades. Today, it operates as a thrift bank with visible relationships across working households, employers, entrepreneurs, merchants, corporations, and small and medium-sized enterprises.

Its banking proposition already extends across deposits, consumer and commercial lending, payroll, corporate banking, merchant acceptance, collections, remittance, housing finance, mobile banking, online account opening, and corporate Internet banking. AllBank also participates in the country's principal retail-payment arrangements.

This is therefore not a guide to becoming digital for the first time.

It considers a different institutional question: whether one reusable governed operating capability beneath AllBank's existing channels, products, payment connectivity, and customer relationships could support additional banking services without requiring their operating foundations to be rebuilt independently.

This approach does not replace AllBank's authority, channels, systems, providers, or settlement relationships. It begins with them. AllBank remains the bank, the customer institution, and the production authority throughout.

The question invites an executive conversation about an enduring operating capability within AllBank's institutional context—without proposing a deployment or assuming AllBank approval or operational readiness.

BOARD BRIEFING

Executive Summary

AllBank has already established substantial digital banking capability. Its services span retail and corporate banking, digital onboarding, mobile access, payroll, bulk payments, merchant acceptance, collections, remittance, housing, and other lending relationships. It participates in InstaPay, PESONet, QR Ph, and Bills Pay PH and has repeatedly extended payment reach through institutional partnerships.

The question is not whether AllBank should become digital. It is whether the institution can organize more of its banking responsibilities through one reusable governed operating foundation.

Settlement connectivity is necessary, but it is not a banking service. A rail can move funds and an API can transmit an instruction. Neither defines what the customer requested, establishes purpose, applies policy, recognizes and reserves resources, gathers evidence, manages exceptions, communicates status, or reconciles the completed service. Those remain responsibilities of the bank.

The Program is the institution-specific initiative through which AllBank would evaluate and, if approved, establish that foundation. The enduring result is the Capability: a maintained operating foundation through which customer requests become authorized, observable, executable, and reconcilable banking activity.

AllBank remains the protagonist. It retains its banking authority, products, customer and deposit relationships, channels, infrastructure, data, policies, credentials, production authority, and settlement relationships. x-change supplies the operating grammar beneath those arrangements. A common execution contract and an AllBank-specific integration driver would connect that grammar to the institution's approved execution capability.

The bank brings the authority and the rails. x-change brings the operating grammar. The bank-specific driver connects them.

The driver is institution-specific engineering, not an automatically available connector. It would require institutional discovery, API mapping, implementation, certification, and continuing maintenance. Certification would establish technical behavior under tested conditions. It would not establish operational readiness. Readiness would remain an AllBank judgment based on the complete banking ceremony.

Remittance makes the model visible. A customer asks the bank to make funds available to another person. The bank recognizes the funds, applies policy, reserves the required capacity, defines the conditions, issues a Pay Code credential, coordinates execution through its approved settlement relationship, preserves evidence, and reconciles the result.

The customer requested a banking outcome. The bank arranged it.

The same foundation could support services already relevant to AllBank. Payroll connects employers and employees. Merchant services connect commerce, settlement, reporting, and business relationships. Collections connect payer information with attribution and reconciliation. Housing and commercial lending may require governed releases against purpose and evidence. Their commercial meaning, participants, policies, and customer journeys differ. The operating grammar remains stable.

The priority among these services, and the operating model supporting them, can be determined only with AllBank. That is the purpose of institutional dialogue.

If AllBank considers the question relevant, the next step would be neither implementation nor commitment, but a structured executive discussion: whether the capability merits formal evaluation, which banking ceremony might best illuminate it, and what evidence AllBank would require before considering controlled production.

SECTION 1

Why This Program?

EXECUTIVE QUESTION

Why might this Program merit AllBank's consideration?

KEY MESSAGE

AllBank already has authority, relationships, channels, digital services, and payment connectivity. The opportunity is to determine whether one governed operating foundation could support more banking services over time.

EXECUTIVE DECISION

I understand the institutional question and can decide whether a reusable governed operating capability merits formal evaluation.

AllBank's history, customer relationships, and regulated authority are institutional assets. Modernization should strengthen them rather than replace them.

The institution already serves consumer and business needs through branches, mobile banking, digital onboarding, AllConnect corporate Internet banking, merchant services, payment participation, and partner relationships. Its visible services include payroll, bulk sending, collections, merchant acceptance, remittance, housing, and commercial lending.

A bank can accumulate functioning channels and integrations without acquiring one reusable operating foundation beneath them. Each new service may bring a different financial-state model, approval process, provider integration, evidence requirement, exception path, and reconciliation practice.

That pattern creates repeated work. It can also make institutional responsibility harder to observe across products and channels. A customer sees a payroll credit, merchant payment, collection reference, transfer, remittance, or loan release. AllBank must see the complete obligation: purpose, authority, funds, conditions, evidence, execution, exceptions, support, and reconciliation.

This initiative addresses that operating question. It does not confer banking authority, create customer relationships, or supply settlement access. It organizes authority and connectivity that AllBank already possesses or establishes through approved relationships.

The timing is practical. Maintained software, modern deployment practices, API-based integration, automated testing, observability, and regulated payment infrastructure now allow an institution to establish a reusable foundation without rebuilding every component for every service.

The opportunity is not technology for its own sake. It is to preserve AllBank's institutional choice while reducing repeated operating and engineering work.

One foundation would not make every AllBank service alike. It would give the bank a consistent way to govern their differences. The next question is what AllBank would establish through the Program.

SECTION 2

What Is the Program?

EXECUTIVE QUESTION

What exactly would AllBank be invited to establish?

KEY MESSAGE

The Program is an AllBank-specific modernization initiative. Its intended result is a maintained operating Capability under AllBank's authority and control.

EXECUTIVE DECISION

I understand the Program, the Capability it is intended to establish, the participating roles, and the boundaries that remain subject to AllBank approval.

The Thrift Bank Digital Banking Program brings together licensed x-change software, institution-specific integration, controlled deployment, observability, testing, documentation, maintenance, and operating governance. The resulting capability coordinates the progression from recognized funds and authorized purpose to conditions, credential, execution, evidence, and reconciliation.

The Program is the initiative. The Capability is the enduring operational result. The terms are not interchangeable. The Program can be evaluated, approved, governed, implemented, and reviewed. The Capability is what AllBank would continue to operate and evolve.

AllBank would be the program sponsor and banking authority. Its Board and Management would establish purpose, risk appetite, scope, accountability, and approval boundaries. Business, Operations, Treasury, Technology, Risk, Compliance, Legal, Information Security, Internal Audit, Finance, and other responsible functions would continue to perform their established roles.

The licensed technology provider would maintain x-change, the common execution contract, supported components, documentation, reference architecture, testing capability, and an institution-specific driver within agreed scope. The provider would not become the bank, the customer owner, the custodian, the settlement institution, or the production authority.

A DevOps or managed-service provider may perform delegated provisioning, deployment, monitoring, backup, recovery, release support, and incident-response work. The provider would act within AllBank's approved environment and delegated authority. It would not own the environment, data, credentials, billing relationships, or release decision.

AllBank's settlement institutions and payment providers would continue to perform supported financial movement under their agreements with the bank. The initiative does not prescribe an exclusive settlement institution. AllBank would own or establish the relevant accounts, participation, credentials, limits, and execution authority.

The precise operating model supporting AllBank's current services is naturally unique to the institution. Any Program design would therefore begin with AllBank's approved architecture and relationships rather than assume a generic deployment.

Common software would not create a common bank. It would provide a maintained operating foundation within AllBank's own institutional boundaries.

Governance follows responsibility. The Board would authorize institutional purpose. Management would own implementation and operating accountability. Responsible functions would validate the complete service. Providers would supply only the capabilities assigned to them. Production could begin only through AllBank's approval process.

The initiative should be judged by whether it establishes the capability under institutional control—not by the quantity of software installed. Its value begins with what that foundation enables AllBank to do.

SECTION 3

Why Might This Matter to AllBank?

EXECUTIVE QUESTION

What institutional value could this capability offer AllBank?

KEY MESSAGE

AllBank could gain a reusable governed foundation through which it may introduce and evolve banking services while preserving its authority, relationships, channels, and operating sovereignty.

EXECUTIVE DECISION

I understand the prospective institutional benefit and can decide whether further evaluation is warranted.

The principal benefit is operating leverage. A maintained grammar for authority, financial state, conditions, credentials, execution, and evidence can reduce the amount of foundational work repeated for each service. AllBank would still perform product design, policy, governance, integration review, training, customer treatment, and support. What changes is the starting point.

Existing channels remain valuable. AllBank Mobile, electronic onboarding, branches, AllConnect, the merchant portal, partner journeys, and approved APIs may initiate, present, or report activity. x-change would coordinate the governed ceremony beneath them. AllBank could improve a customer journey without redefining the financial state of the service, and it could add a channel without creating another independent settlement model.

Operating sovereignty would remain intact. AllBank would own or control its approved environment, deployment, data, domains, provider accounts, credentials, monitoring, backups, security configuration, releases, and audit trail. It would retain its customer and deposit relationships and its direct settlement relationships.

The same foundation could support services with different institutional purposes.

Payroll can connect employers, employees, deposits, payments, and continuing retail relationships. Merchant services can connect acceptance, settlement, reporting, liquidity, and business banking. Collections can connect payer information with matching, exceptions, and corporate reconciliation. Housing and commercial lending can connect approved finance with governed releases and continuing records. Remittance can serve a familiar immediate need while opening a broader household relationship.

These possibilities are not automatic returns or statements of AllBank priority. They become valuable only when the institution selects relevant services and operates them well. The credible benefit is the capacity to introduce, govern, and evolve services whose institutional and commercial value AllBank has independently established.

This approach also changes where scarce attention is spent. Rather than repeatedly rebuilding common orchestration machinery, AllBank can concentrate more management and engineering effort on customer relationships, product judgment, risk appetite, service quality, and chosen markets.

AllBank modernizes without becoming less itself. The operating model preserves that institutional boundary by design.

SECTION 4

How Does the Program Work?

EXECUTIVE QUESTION

How would the operating model work within AllBank?

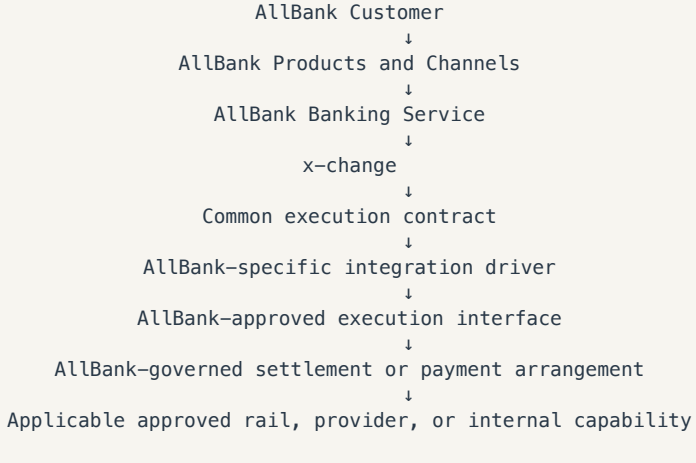

KEY MESSAGE

AllBank retains custody and authority. x-change coordinates the banking ceremony, and an AllBank-specific driver connects that ceremony to the institution's approved execution capability.

EXECUTIVE DECISION

I understand where authority, funds, software, integration, execution, evidence, and reconciliation would reside.

The conceptual institutional stack is:

The customer channel presents an experience. The banking service expresses AllBank's customer proposition, policy, terms, and responsibility. x-change coordinates the governed banking ceremony. The common execution contract provides a stable integration boundary. The AllBank-specific integration driver would translate that contract into behavior approved by the institution.

No production driver is assumed. Its feasibility and design would depend on discovery of AllBank's approved systems, interfaces, credentials, status models, controls, settlement arrangements, evidence, and reconciliation responsibilities.

The operating grammar keeps distinct responsibilities from being mistaken for one another.

A Funding Event records the external financial event through which Settlement Resources enter or become recognized by Treasury. It records institutional recognition; it does not create the underlying value.

Treasury maintains the operational state of Settlement Resources supporting the bank's activities. A Lien reserves capacity for an authorized purpose while an instruction remains outstanding.

A Facility gives the banking activity its purpose, participants, policies, commercial rules, and institutional responsibility. Commercial meaning belongs to the Facility.

A Settlement Envelope defines the evidence and conditions that must be satisfied before an instruction may proceed. Identity, approval, limits, documents, signatures, one-time passwords, beneficiary information, and other AllBank-defined requirements belong here.

A Pay Code represents an authorized instruction in a form that can be communicated, presented, validated, and executed. It is a credential—not money, a deposit, a wallet balance, or the banking service itself.

The banking service is the product. The Pay Code is the credential.

Execution coordinates the progression from authorized instruction to the outcome defined by the Facility. The execution engine and institution-specific driver address an AllBank-approved execution interface. Provider and institutional references, status, exceptions, and evidence return to the operating record for reconciliation.

Custody would not move into x-change. The underlying funds would remain within AllBank's regulated relationships. Treasury provides an operational view; it does not replace the bank account or determine the legal character of funds.

Technical completion remains narrower than readiness. A certified driver may perform agreed API behavior under tested conditions. AllBank must still decide whether the complete service can be authorized, operated, supervised, secured, settled, reconciled, supported, and governed.

SECTION 5

Banking in Action

EXECUTIVE QUESTION

How could the capability apply to banking services relevant to AllBank?

KEY MESSAGE

One operating grammar can support different AllBank services because purpose and policy may change while the responsibilities beneath them remain governed consistently.

EXECUTIVE DECISION

I can recognize how the operating model applies to a familiar ceremony and how the same foundation could support other services AllBank may choose to govern through it.

Remittance provides the clearest explanatory ceremony because it makes the complete discipline visible within one familiar request. It forms part of AllBank's service portfolio, while the institution's operating journey can be understood only with AllBank.

A customer asks the bank to make funds available to another person. The bank receives or recognizes the funds, confirms authority, applies policy, records the remittance purpose, and identifies the recipient and permitted conditions.

Treasury recognizes the supporting Settlement Resources. A Lien reserves the required amount. The remittance Facility defines participants, limits, commercial rules, customer communication, and service responsibility. The Settlement Envelope records evidence and conditions. Once authorized, a Pay Code permits the instruction to be communicated and presented through an approved journey.

The recipient presents the Pay Code and satisfies the conditions. Execution coordinates the instruction through the bank's approved relationship. The institution-specific driver translates the common execution contract into approved API behavior. The financial movement occurs. x-change records the result, updates operational state, resolves the Lien, preserves evidence, and supports reconciliation and customer communication.

> The customer requested a banking outcome. The bank arranged it.

AllBank's service portfolio brings several other ceremonies into view:

Banking service	AllBank relevance	What remains governed
Payroll	**Employer instructions, employee attribution, recurring deposits, bulk release**	**Funding, authority, reservation, timing, exceptions, evidence, reconciliation**
Merchant services	**QR Ph acceptance, merchant relationships, settlement and reporting**	**Onboarding, conditions, execution, disputes, evidence, reconciliation**
Collections	**Bills payment, account sweeping, PDC warehousing, deposit services**	**Payer reference, purpose, matching, exceptions, reporting, evidence**

Banking service	AllBank relevance	What remains governed
Housing and commercial releases	Existing lending relationships and approved disbursement purposes	Documentary conditions, payees, stages, authority, execution, continuing records
Remittance	A familiar customer outcome and potential continuing household relationship	Funding, recipient conditions, credential, execution, evidence, reconciliation

The table identifies relevance, not priority. If AllBank chooses to explore this capability, it can select the ceremony that best combines institutional importance, bounded scope, operating familiarity, and readiness to learn.

One ceremony makes the grammar visible. Many services make the foundation useful.

SECTION 6

The Institutional Case

EXECUTIVE QUESTION

What institutional case might AllBank consider?

KEY MESSAGE

This capability could deepen relationships, preserve institutional choice, and lower repeated innovation cost while commercial value remains dependent on disciplined service selection and operation.

EXECUTIVE DECISION

I understand the institutional and commercial case and can decide whether it merits detailed evaluation under AllBank's strategy and financial authority.

A bank can retain an account while losing the practical center of a customer relationship. Salary may arrive elsewhere. Business collections may move through another provider. Merchant activity may be separated from deposits and credit. Household payments may migrate while the formal banking relationship remains.

The reverse can also occur. Payroll can connect an employer and employees to AllBank. Collections can connect the bank to the rhythm of an enterprise. Merchant services can connect commerce with liquidity and lending. Housing can sustain a long relationship. Remittance can become a recurring family relationship.

AllBank's service portfolio already touches many of these relationships. The institutional question is whether selected services can reinforce one another through repeated usefulness.

Over time, financial activity is more likely to return to an institution that remains useful across recurring needs.

This tendency is Transaction Gravity.

Transaction Gravity is not transaction volume alone and creates no entitlement to customer relevance. Service, pricing, channels, support, and fair exception handling still determine whether customers return. Its value is relational: the bank becomes a more natural place for income, deposits, payments, collections, obligations, and financial decisions to meet.

This capability supports adaptability. Resilience allows AllBank to continue through difficulty; adaptability allows it to assume new responsibilities through an established foundation. The institution cannot predict every service required over the next decade. It can preserve the ability to evaluate new services without rebuilding its operating foundation each time.

The commercial case remains disciplined. Costs may include licensing, institution-specific implementation, driver engineering and maintenance, bank infrastructure, managed operations, internal governance and operations, settlement-provider charges, and continuing support. Economic value may arise through service income, stronger deposits, deeper employer and merchant relationships, reduced duplicated engineering, and the ability to introduce relevant services more efficiently. None is automatic.

Detailed economics require AllBank information and separate commercial analysis. Prices, volumes, savings, and returns should be assessed only after the institution has defined the service and supplied the evidence required to evaluate them.

The Board would be deciding more than whether to acquire software. It would be deciding whether AllBank should establish a reusable operating foundation through which its authority and relationships may support more services over time.

SECTION 7

Launching the Program

EXECUTIVE QUESTION

What would happen if AllBank later authorized the Program?

KEY MESSAGE

A possible next step is institutional dialogue around one bounded banking ceremony–not an immediate production decision.

EXECUTIVE DECISION

I understand the institutional journey and the questions AllBank would need to resolve before authorizing implementation or controlled production.

The appropriate first step is to understand the institution directly.

AllBank would identify the customer need, product context, authority, source and destination of funds, policies, approvals, evidence, channels, systems, accounting, reconciliation, support, exceptions, settlement arrangements, and institutional owners relevant to one candidate ceremony.

The bank would then determine which ceremony best combines strategic importance, bounded scope, operating familiarity, and readiness to learn. Payroll, merchant services, collections, housing-related release, and remittance each offer a different institutional lens. The choice belongs to AllBank.

The customer journey would be defined as part of the banking service, not as a separate design exercise. The ceremony would identify what AllBank agrees to do, what evidence is required, how customers are informed, how exceptions are handled, and what completion means.

Driver discovery would examine approved interface behavior, authentication, certificates, request and response structures, references, idempotency, webhooks, status, limits, exceptions, reversals, reconciliation evidence, test environments, and change processes. Only after this work could the feasibility and scope of an AllBank-specific integration driver be established.

If AllBank later authorized implementation, certification would remain a technical gate. Operational readiness would remain a separate institutional gate. Bank personnel would need to validate initiation, approvals, Funding Events, Treasury state, Liens, Facility rules, Settlement Envelope conditions, Pay Code presentation, execution, provider behavior, accounting, evidence, support, reconciliation, failure, delay, duplication, reversal, and uncertain outcomes as one banking operation.

Readiness is an institutional judgment. It exists only when AllBank has sufficient evidence that the ceremony can be authorized, operated, supervised, secured, settled, reconciled, supported, and governed under its authority.

No conclusion about implementation or readiness is presumed.

The immediate invitation is narrower: confirm whether the institutional question is relevant, identify the banking responsibility through which it should be examined, and establish what AllBank would need to know before considering any further decision.

The next step is a disciplined institutional dialogue: whether this capability belongs within AllBank's future, and which banking responsibility should test that judgment first.

INSTITUTIONAL REFERENCE

Annexes

The annexes preserve the operating, governance, and Treasury distinctions required to evaluate the Program. They provide institutional reference without becoming an implementation specification.

- Annex A — Canonical Operating Model
- Annex B — Banking Ceremonies
- Annex C — Bank Driver Architecture
- Annex D — Governance Principles
- Annex E — Treasury and Settlement Grammar
- Annex F — Institutional Readiness Framework
- Annex G — Glossary
- Annex H — Applying This Program Guide to AllBank

ANNEX A

Canonical Operating Model

The operating model separates the customer proposition, governed banking ceremony, common execution contract, institution-specific integration, and regulated financial movement.

```
                                AllBank Customer Channel
                                          ↓
                               AllBank Banking Service
                                          ↓
                                      x-change
                                          ↓
                              Common execution contract
                                          ↓
                          AllBank-specific integration driver
                                          ↓
                         AllBank-approved execution interface
                                          ↓
                  AllBank-governed settlement or payment arrangement
                                          ↓
            Applicable approved rail, provider, or internal capability
```

This model is conceptual. It describes institutional responsibilities and integration boundaries, not a production topology.

The AllBank customer requests a banking outcome through an institution-approved journey.

AllBank products and channels initiate, present, or report banking activity. They may include branches, mobile and Internet banking, corporate channels, merchant journeys, partner journeys, and approved APIs.

The AllBank banking service defines the customer outcome, participants, terms, policy, commercial meaning, service responsibility, and customer treatment. The banking service remains the product.

x-change coordinates the governed banking ceremony: recognized resources, purpose, authority, conditions, credential, execution, evidence, exceptions, and reconciliation.

The common execution contract allows the operating grammar to address an institution-specific execution capability without making provider behavior part of the banking service.

The AllBank-specific integration driver would translate the common contract into the institution's approved authentication, request, response, reference, status, webhook, exception, reversal, security, and reconciliation behavior. Its maintained component identity is described in Annex C.

AllBank-approved execution interfaces and governed settlement or payment arrangements remain under the authority of AllBank and its providers. Financial movement occurs through the bank's regulated relationships. The software neither creates settlement access nor assumes custody.

The model preserves three boundaries:

1. AllBank defines and owns the banking service.
2. The operating grammar coordinates the service without replacing institutional authority.
3. Execution reaches approved financial infrastructure only through bank-governed integration.

Common software does not create a common bank.

AllBank retains its own policies, environment, data, credentials, customer relationships, settlement relationships, production decisions, and audit trail.

ANNEX B

Banking Ceremonies

A governed banking ceremony is the complete progression through which a customer request becomes authorized, executable, evidenced, and reconciled banking activity. The ceremonies below illustrate how one operating grammar can support different institutional purposes. They do not establish AllBank priorities or implementation scope.

Payroll

An employer submits an authorized payroll instruction and provides or identifies the supporting funds. AllBank validates authority, timing, employee attribution, limits, exceptions, and required evidence. Treasury recognizes the Settlement Resources and reserves the required capacity. The payroll Facility defines the service and its commercial rules. Settlement Envelopes establish the conditions for release. Execution proceeds through the bank's approved capability, and the resulting institutional and provider evidence supports reporting, exception handling, and reconciliation.

Payroll may connect employer banking, employee deposits, payments, and continuing retail relationships. Its value depends on AllBank's service design and operation; the operating grammar does not determine the commercial proposition.

Merchant Settlement

A merchant accepts customer payments through an AllBank-approved channel or arrangement. The merchant Facility defines participation, settlement terms, fees, timing, exceptions, and reporting. Treasury distinguishes recognized resources from amounts reserved or unresolved. Settlement Envelopes carry the conditions and evidence required before settlement. Execution coordinates approved movement, while the operating record supports merchant reporting, disputes, exceptions, and reconciliation.

The ceremony connects acceptance to a governed merchant relationship. QR or payment connectivity alone does not define the complete service.

Collections

A payer submits funds for a defined obligation. AllBank captures the payer, biller, purpose, reference, amount, channel, and applicable conditions. The collections Facility defines matching and exception rules. The Settlement Envelope preserves required evidence. Execution coordinates the approved financial outcome. The completed record supports attribution, posting, exception resolution, biller reporting, and reconciliation.

The ceremony is valuable because it connects financial movement with institutional meaning. A successful transfer without reliable attribution may still leave the collection unresolved.

Housing Finance

An approved housing-finance obligation may require release to a borrower, seller, developer, contractor, or other authorized recipient after defined conditions are satisfied. The Facility carries the financing purpose, participants, policies, stages, limits, and service responsibility. The Settlement Envelope records documentary

and approval conditions. Treasury reserves the authorized resources. A Pay Code may represent the instruction where the approved journey requires one. Execution proceeds only after the bank's conditions are satisfied, with evidence retained for the continuing financing record and reconciliation.

The ceremony does not replace credit approval, legal review, collateral administration, or the bank's lending systems. It governs an authorized release within the wider banking relationship.

Remittance

A customer asks AllBank to make funds available to another person. The bank receives or recognizes the funds, applies policy, identifies the recipient, defines the service conditions, and accepts responsibility for the outcome. Treasury recognizes and reserves the required resources. The remittance Facility carries purpose and service rules. The Settlement Envelope records evidence and conditions. A Pay Code represents the authorized instruction. The recipient satisfies the conditions, and execution coordinates the financial movement through AllBank's approved relationship. The operating record preserves status, evidence, exceptions, and reconciliation.

The customer requested a banking outcome. The bank arranged it.

Across these ceremonies, purpose and policy change. The responsibilities remain recognizable: funds, authority, conditions, credential where required, execution, evidence, exception handling, and reconciliation.

ANNEX C

Bank Driver Architecture

The bank-specific driver connects the common execution contract to AllBank's approved API behavior.

```
                                    x-change
                                       ↓
                                    emi-core
                                       ↓
                                  emi-allbank
                                       ↓
                  AllBank-approved execution interfaces and capabilities
```

`emi-allbank` is the concise institutional label used in this annex. Within the maintained component grammar, the driver is represented conceptually as `3neti/emi-allbank`.

The driver adapts technology. It does not provide banking authority, settlement participation, custody, product definition, policy, or production approval. AllBank brings the authority and the rails. x-change brings the operating grammar. The bank-specific driver connects them.

No production driver is assumed to exist. Institution-specific engineering would require:

1. Institutional discovery — establish the approved systems, interfaces, environments, settlement arrangements, credentials, controls, owners, evidence, and reconciliation responsibilities relevant to the selected ceremony.
2. API mapping — map `emi-core` operations to AllBank-approved authentication, certificates, requests, responses, references, idempotency, statuses, webhooks, limits, exceptions, reversals, and provider behavior.
3. Implementation — create the maintained driver within approved architecture, security, coding, testing, release, and documentation practices.
4. Certification — demonstrate agreed technical behavior under controlled conditions, including success, failure, delay, duplication, uncertain status, and recovery paths.
5. Continuing maintenance — manage API changes, certificates, security updates, provider changes, test evidence, observability, defects, releases, and compatibility with the maintained common contract.

The driver should expose a stable execution contract to the operating grammar while preserving provider-specific detail at the institutional boundary. It should return references, status, evidence, and exceptions required by the complete banking ceremony rather than reduce execution to a successful API response.

Driver certification is necessary where the integration is used, but it is not operational readiness. AllBank must still judge whether the banking service can be authorized, operated, supervised, secured, settled, reconciled, supported, and governed.

ANNEX D

Governance Principles

Governance follows institutional responsibility. No provider approval substitutes for AllBank approval.

Participant	Principal responsibility	Institutional boundary
Board of Directors	Approves institutional purpose, risk appetite, scope, accountability, and material progression	Fiduciary responsibility is not delegated to a technology provider
President, CEO, and Management	Own Program sponsorship, resources, accountability, and management decisions	Board approval does not constitute production readiness
Business and Product	Define the banking service, customer responsibility, policy, terms, and economic case	Technical credentials do not carry commercial meaning
Operations	Define supervision, support, escalation, exception handling, evidence, and reconciliation practice	Technical completion is not an operating decision
Treasury	Governs the operational view of Settlement Resources, reservations, and unresolved obligations	Software state does not replace the bank account or determine legal fund character
Technology	Governs architecture, integration, environments, identity, observability, resilience, service management, and release	External engineering extends rather than displaces institutional capability
Risk and Compliance	Review risks, controls, obligations, monitoring, and customer treatment within authority	Accountability does not transfer to certification artifacts
Legal	Reviews agreements, authority, customer terms, data treatment, and legal characterization	This Guide is not a legal agreement or legal opinion
Information Security	Governs access, credentials, certificates, testing, monitoring, incident response, and change	Production secrets remain under approved institutional control
Finance and Accounting	Define accounting, financial reporting, provider-charge treatment, and reconciliation requirements	Commercial estimates require separate financial approval
Internal Audit	Provides independent assurance according to its mandate	Internal Audit does not become an implementation owner
ODTI	Licenses and maintains x-change, `emi-core`, supported components, documentation, testing capability, and the bank-specific driver within scope	ODTI does not provide banking authority, custody, settlement access, or production approval
DevOps or managed-service provider	Performs delegated provisioning, deployment, monitoring, backup, recovery, release support, and incident work	The provider does not own AllBank's environment, data, credentials, billing, or release authority
Settlement institution or payment provider	Performs supported financial movement and provides records under its agreement with AllBank	The provider does not define AllBank's customer product or complete ceremony

The principal decision gates are:

1. Program authorization — the Board or delegated authority permits Management to evaluate and establish the Program.
2. Service definition — AllBank approves the first banking ceremony and its accountable owners.

3. Architecture and security approval — responsible functions approve the intended environment and integration boundary.
4. Driver certification — agreed technical behavior is evidenced under controlled conditions.
5. Operational readiness — AllBank judges the complete ceremony ready for bounded production.
6. Pilot decision — the institution authorizes a limited production scope.
7. Evidence review — the institution decides to Proceed, Correct, Extend, or Pause.

This model preserves operating sovereignty. AllBank retains control over authority, customer relationships, policy, infrastructure, data, credentials, production decisions, settlement relationships, and its institutional audit trail.

AllBank's approved banking, accounting, customer, and settlement systems remain institutional systems of record. x-change coordinates the governed ceremony and preserves its operating evidence; it does not replace those systems or redefine their authority.

ANNEX E

Treasury and Settlement Grammar

Treasury provides the operational financial-state grammar supporting a governed banking ceremony.

Canonical progression

```
External financial event
↓
Funding Event
↓
Settlement Resources recognized by Treasury
↓
Lien reserves resources for an authorized purpose
↓
Facility gives the activity banking and commercial meaning
↓
Settlement Envelope establishes evidence and conditions
↓
Pay Code represents the authorized instruction
↓
Execution coordinates the approved outcome
↓
Evidence, state resolution, and reconciliation
```

Governing distinctions

- A Funding Event records an external event; it does not manufacture funds.
- Treasury represents operational state; it is not the bank account or general ledger.
- Settlement Resources remain subject to their actual custody, ownership, legal character, and institutional controls.
- A Lien reserves capacity; it does not transfer custody.
- A Facility carries banking and commercial meaning; a Pay Code does not.
- A Settlement Envelope carries conditions and evidence; it does not perform settlement.
- A Pay Code is a credential; it is not money, a deposit, stored value, or the service itself.
- Execution coordinates the authorized outcome through AllBank's approved capability.
- Reconciliation compares operating state with institutional and provider evidence and resolves differences through approved procedures.

The underlying funds remain within AllBank's regulated relationships throughout. Treasury gives the ceremony an operational view of what is recognized, reserved, available, or unresolved. It neither assumes custody nor changes the legal character of funds.

Commercial meaning belongs to the Facility. The Facility identifies why the activity exists, who participates, what rules and limits apply, and what responsibility AllBank accepts. The Settlement Envelope then establishes what must be true before the instruction proceeds. This separation allows evidence and conditions to evolve without confusing them with the banking product.

Execution completes neither the institutional record nor the bank's responsibility by itself. Provider references, statuses, exceptions, and evidence must return to the operating record. Treasury state, Liens, accounting, customer communication, exception handling, and reconciliation must then be resolved according to approved procedures.

ANNEX F

Institutional Readiness Framework

Readiness is AllBank's judgment that sufficient evidence exists to authorize, operate, supervise, secure, settle, reconcile, support, and govern a banking ceremony.

The judgment should address the complete institution, not only software behavior.

Readiness dimension	Evidence required before bounded production
Governance	Approved purpose, accountable owners, decision rights, escalation, pilot authority, and review criteria
Banking service	Defined customer outcome, participants, policy, terms, limits, channels, communications, and fair treatment
Operations	Documented initiation, approval, supervision, support, exceptions, recovery, evidence, reconciliation, and end-of-day responsibilities
Treasury and settlement	Confirmed Funding Events, Settlement Resources, Liens, accounts, limits, liquidity, references, statuses, unresolved-state treatment, and settlement responsibilities
Risk, Compliance, and Legal	Reviewed regulatory obligations, risks, controls, customer terms, agreements, data treatment, and legal characterization
Technology and architecture	Approved environments, interfaces, identities, observability, capacity, resilience, backup, recovery, service management, and change processes
Information security	Approved access, credentials, certificates, secrets, testing, monitoring, incident response, vulnerability management, and production controls
Finance and accounting	Defined entries, fees, provider charges, reporting, reconciliation, exception treatment, and financial-control ownership
Customer experience	Tested initiation, evidence gathering, disclosures, status communication, assistance, failure treatment, and completion experience
People and providers	Trained personnel, operating procedures, support coverage, provider obligations, service levels, escalation paths, and continuity arrangements
Evidence and assurance	Test results, driver certification, operating rehearsals, control evidence, unresolved findings, approvals, and independent review where required

Certification demonstrates that the AllBank-specific driver performs agreed technical behavior under tested conditions. It does not decide whether the product is suitable, the policy is approved, the staff are prepared, the settlement model is sufficient, the accounting is correct, customers can be supported, or exceptions can be governed.

Operational readiness therefore follows certification; it is not produced by certification. AllBank may authorize a limited pilot only when responsible functions have evaluated the complete ceremony and accepted the bounded production conditions.

Pilot evidence should be reviewed through the institutional choices Proceed, Correct, Extend, or Pause. A successful technical transaction is evidence within that review, not the review itself.

ANNEX G

Glossary

These definitions apply to this Program and remain subordinate to the governing x-change and Treasury grammar.

Capability — The enduring, maintained operating foundation established through the Program. It allows AllBank to turn customer requests into governed banking activity.

Program — The institution-specific initiative through which AllBank evaluates, establishes, governs, and introduces the Capability.

Funding Event — The record of an external financial event through which Settlement Resources enter or become recognized by Treasury. It records recognition; it does not create the underlying value.

Treasury — The operational view of Settlement Resources supporting the bank's activities, including what is recognized, reserved, available, or unresolved. It is not the bank account itself.

Settlement Resources — The resources recognized by Treasury as supporting an activity. Their custody and legal character remain within AllBank's regulated arrangements.

Lien — An operational reservation of Settlement Resources for an authorized purpose while an instruction remains outstanding.

Facility — The governed definition of a banking service. It carries purpose, participants, policies, commercial rules, limits, and institutional responsibility.

Settlement Envelope — The evidence and conditions that must be satisfied before an instruction may proceed.

Pay Code — A credential representing an authorized instruction in a form that can be communicated, presented, validated, and executed. It is not money, a deposit, stored value, or the banking product.

Execution — The coordination of an authorized instruction toward the banking outcome defined by the Facility through AllBank's approved execution capability.

Execution Engine — The component that coordinates the supported execution progression and invokes the applicable driver.

`emi-core` — The maintained common contract through which the operating grammar addresses institution-specific execution capability.

Driver / `3neti/emi-allbank` — The maintained institution-specific implementation of `emi-core` for AllBank's approved execution interface, authentication, status, webhook, security, exception, and reconciliation behavior.

Governed Banking Ceremony — The complete progression from customer request and recognized funds through policy, authority, conditions, execution, evidence, exception handling, and reconciliation.

Readiness — AllBank's institutional judgment that sufficient evidence exists to authorize, operate, supervise, secure, settle, reconcile, support, and govern a ceremony.

Certification — Evidence that the AllBank-specific driver performs agreed technical behavior under tested conditions. Certification is not operational readiness.

Transaction Gravity — The tendency for financial activity to return to an institution that remains useful across recurring customer and enterprise needs.

Operating sovereignty — AllBank's continuing control over its banking authority, customer relationships, policies, infrastructure, data, credentials, production decisions, settlement relationships, and institutional audit trail.

ANNEX H

Applying This Program Guide to AllBank

This paper was prepared for an institution that already possesses banking authority, established customer relationships, digital channels, payment participation, lending activities, and service relationships across households and enterprises.

AllBank's published banking services informed the selection of institutional examples. Payroll, bulk payments, merchant acceptance, collections, remittance, housing finance, commercial lending, mobile banking, digital onboarding, and corporate Internet banking make the institutional question concrete without determining the institution's priorities.

The Guide identifies where one governed operating capability may align with those responsibilities. It preserves the boundary between AllBank's banking service and the software supporting it; between AllBank's settlement authority and the driver connecting approved execution interfaces; and between technical certification and institutional readiness.

The discussion does not assert how AllBank currently performs each ceremony, recommend a production design, select an initial service, establish commercial terms, or conclude that the institution is ready to proceed. Those decisions require direct institutional knowledge and AllBank authority.

The result is a basis for executive dialogue. If the institutional question is relevant, AllBank can select one bounded banking responsibility, examine its complete ceremony, and determine what evidence would be required before any further decision.
